

# Usage

You have the option of importing all of Fundamental NGX at once, or you can import individual components as you need them. To import the whole library, add:

```
import { FundamentalNgxModule } from 'fundamental-ngx';
```

to your app module definition. Also add `FundamentalNgxModule` to the `imports` array in the `@NgModule` declaration.

To include an individual Angular Fundamental component in your application, you only need to import the relevant module. For example, if you wanted to use Alerts, you would add:

```
import { AlertModule } from 'fundamental-ngx';
```

Then add `AlertModule` to the `imports` array in the `@NgModule` declaration.

Lastly, simply add the component to your HTML!

```
<fd-alert [dismissible]="true" type="warning" (close)="showAlert($event)">  
  A dismissible warning type alert.  
</fd-alert>
```
